

With this proposal I would like to give an overview of *Santa Barbara*, a weeklong workshop for architecture and engineering students.

It's a workshop in which we will develop a tool to challenge physical borders and other boundaries.

A vehicle which helps us to collectively think about access, mobility and self-empowerment.

A machine adapted to the human body, operated by hand, made from affordable materials.

We will build the Do It Yourself Tunnel Digging Machine – something which so far only exists in theory but through this workshop could soon become reality.

Let's make this happen!

Jan
